Lecture 10

Lecture 10: External Merge Sort

Today's Lecture

- 1. External merge sort
- 2. External merge sort on larger files
- 3. Optimizations for sorting

Lecture 10 > Section 1

1. External Merge Sort

Recap: External Merge Algorithm

- Suppose we want to merge two **sorted** files both much larger than main memory (i.e. the buffer)
- We can use the external merge algorithm to merge files of arbitrary length in 2*(N+M) IO operations with only 3 buffer pages!

Our first example of an "IO aware" algorithm / cost model

Why are Sort Algorithms Important?

- Data requested from DB in sorted order is extremely common
 - e.g., find students in increasing GPA order
- Why not just use quicksort in main memory??
 - What about if we need to sort 1TB of data with 1GB of RAM...

A classic problem in computer science!

More reasons to sort...

- Sorting useful for eliminating *duplicate copies* in a collection of records (Why?)
- Sorting is first step in *bulk loading* B+ tree index.

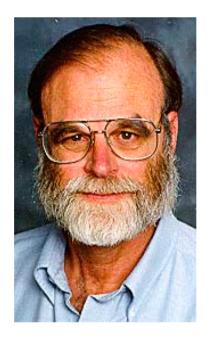

Coming up...

• *Sort-merge* join algorithm involves sorting

Do people care?

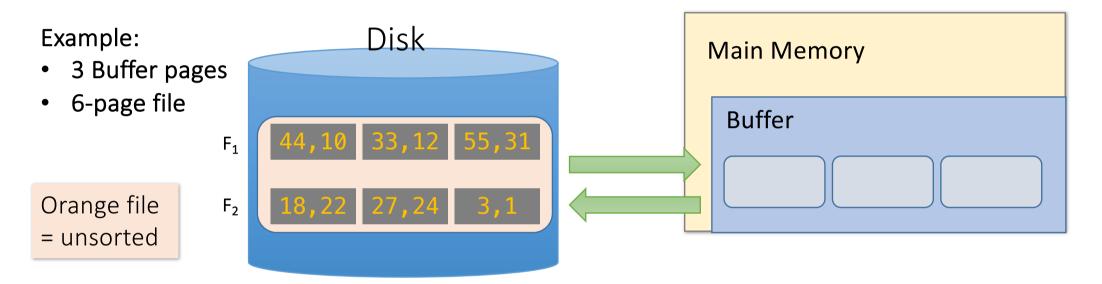

http://sortbenchmark.org

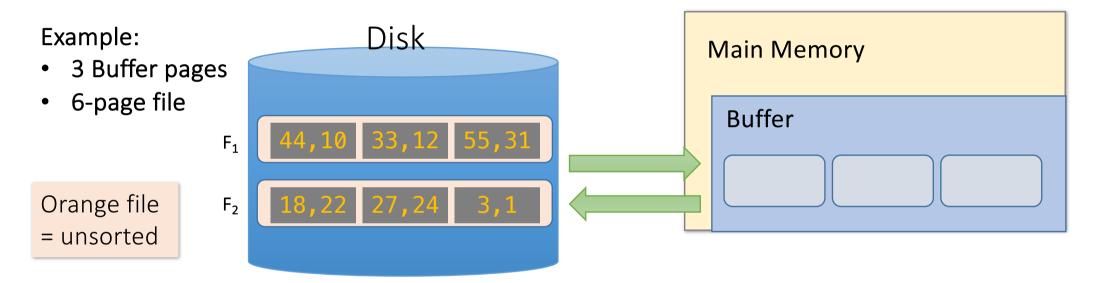

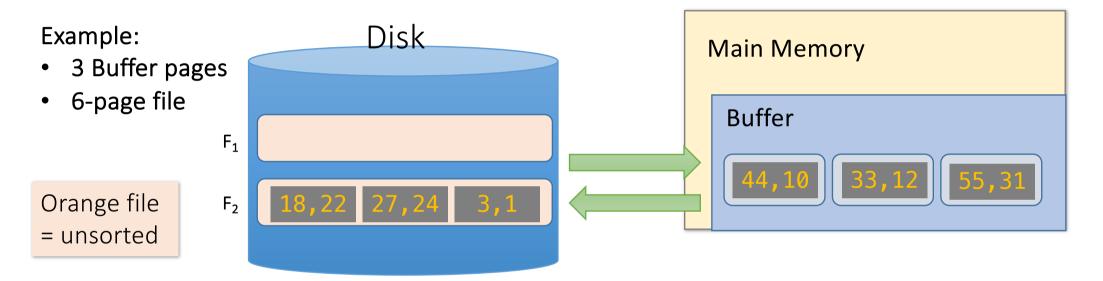

Sort benchmark bears his name

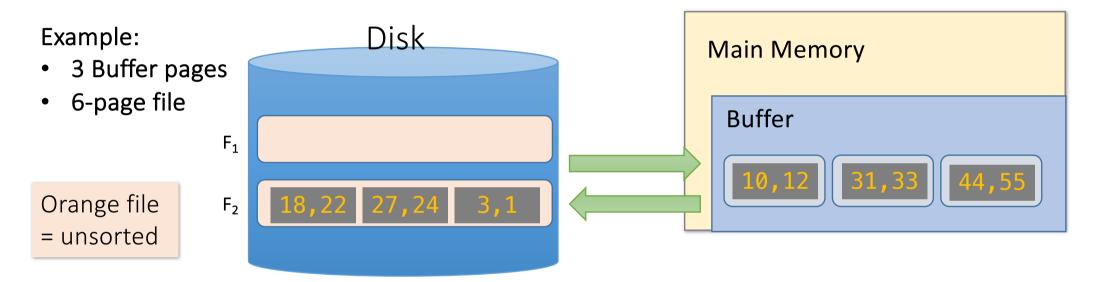

So how do we sort big files?

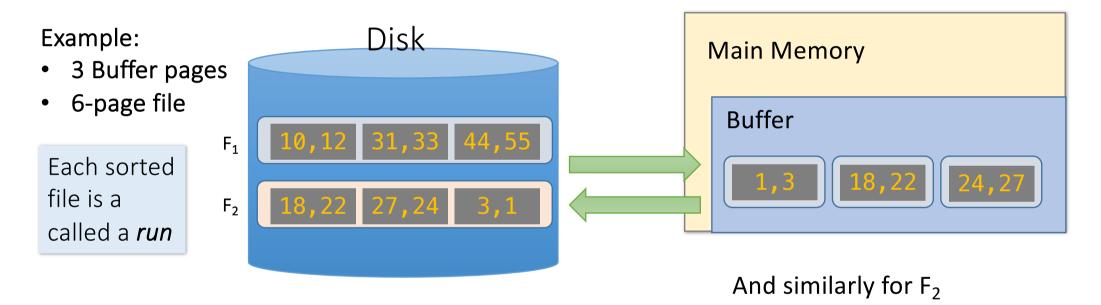

- 1. Split into chunks small enough to **sort in memory ("runs")**
- 2. Merge pairs (or groups) of runs using the external merge algorithm
- **3. Keep merging** the resulting runs *(each time = a "pass")* until left with one sorted file!

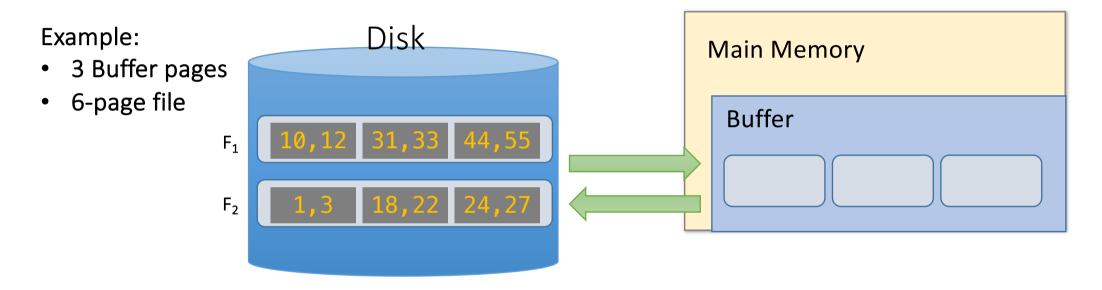

2. Now just run the **external merge** algorithm & we're done!

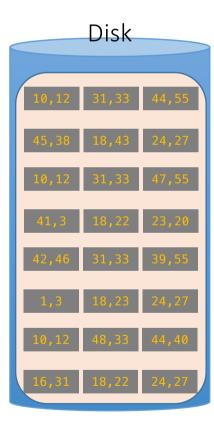

Calculating IO Cost

For 3 buffer pages, 6 page file:

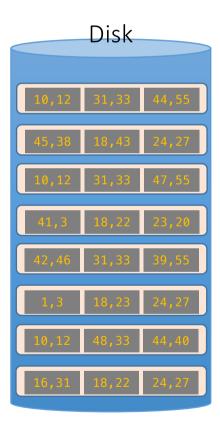

- Split into <u>two 3-page files</u> and sort in memory
 = 1 R + 1 W for each file = 2*(3 + 3) = 12 IO operations
- 2. Merge each pair of sorted chunks *using the external merge algorithm*
 - 1. $= 2^{*}(3 + 3) = 12$ IO operations
- 3. Total cost = 24 IO

Lecture 10 > Section 2

2. External Merge Sort on larger files

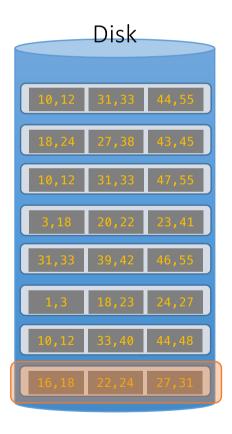

Assume we still only have 3 buffer pages (Buffer not pictured)

1. Split into files small enough to sort in buffer...

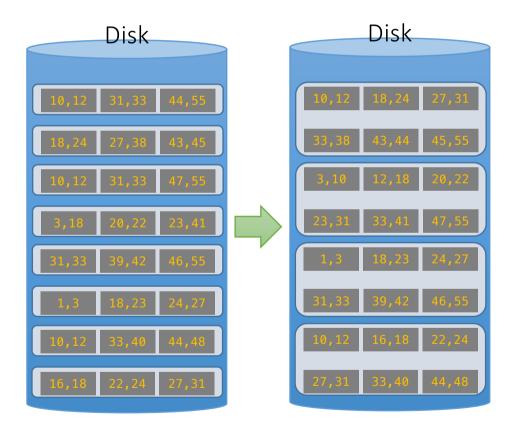

Assume we still only have 3 buffer pages (Buffer not pictured)

1. Split into files small enough to sort in buffer... and sort

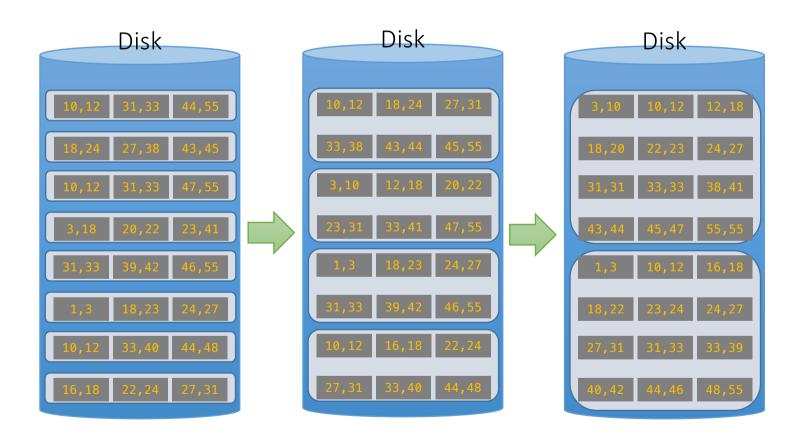

Assume we still only have 3 buffer pages (Buffer not pictured)

Call each of these sorted files a *run*

Assume we still only have 3 buffer pages (Buffer not pictured)

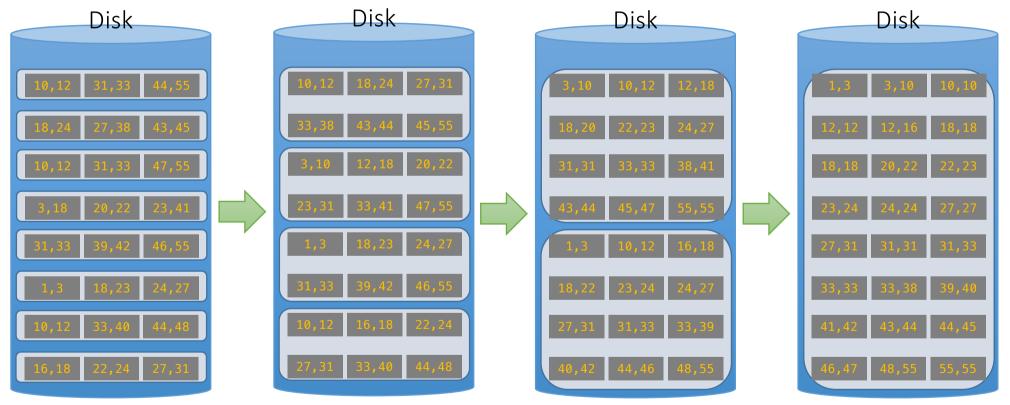

2. Now merge pairs of (sorted) files... the resulting files will be sorted!

Assume we still only have 3 buffer pages (Buffer not pictured)

3. And repeat...

Call each of these steps a *pass*

4. And repeat!

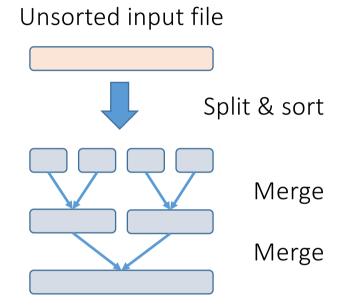

Simplified 3-page Buffer Version

Assume for simplicity that we split an N-page file into N single-page *runs* and sort these; then:

- First pass: Merge N/2 pairs of runs each of length 1 page
- Second pass: Merge N/4 pairs of runs each of length 2 pages
- In general, for N pages, we do $[log_2 N]$ passes
 - +1 for the initial split & sort

→ 2N*([*log*₂ *N*]+1) total IO cost!

Sorted!

Lecture 10 > Section 3

3. Optimizations for sorting

Using B+1 buffer pages to reduce # of passes

Suppose we have B+1 buffer pages now; we can:

1. Increase length of initial runs. Sort B+1 at a time!

At the beginning, we can split the N pages into runs of length B+1 and sort these in memory

IO Cost:

$$2N(\lceil \log_2 N \rceil + 1) \implies 2N(\left\lceil \log_2 \frac{N}{B+1} \right\rceil + 1)$$

Starting with runs of length 1

Starting with runs of length *B***+1**

Using B+1 buffer pages to reduce # of passes

Suppose we have B+1 buffer pages now; we can:

2. Perform a B-way merge.

On each pass, we can merge groups of **B** runs at a time (vs. merging pairs of runs)!

IO Cost:

$$\frac{2N(\left[\log_2 N\right] + 1)}{Starting with runs} \xrightarrow{Starting with runs of} \left[\log B + 1\right] + 1) \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow{N} \frac{2N(\left[\log B + 1\right] + 1)}{B + 1} \xrightarrow$$

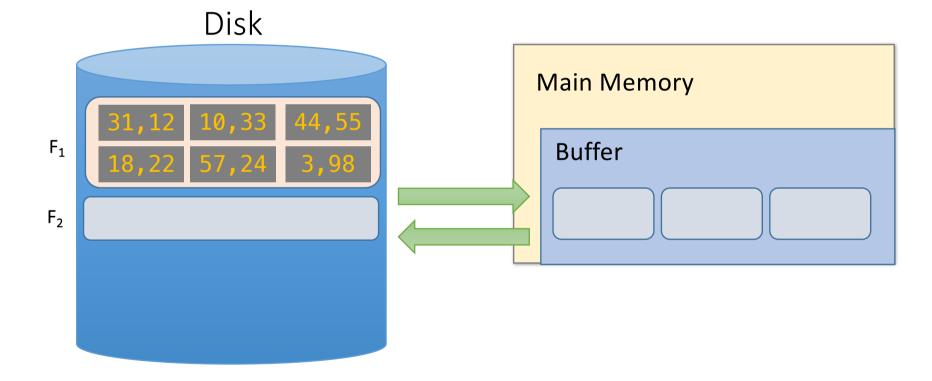

Lecture 10 > Section 3 > Optimizations for sorting

Repacking

Repacking for even longer initial runs

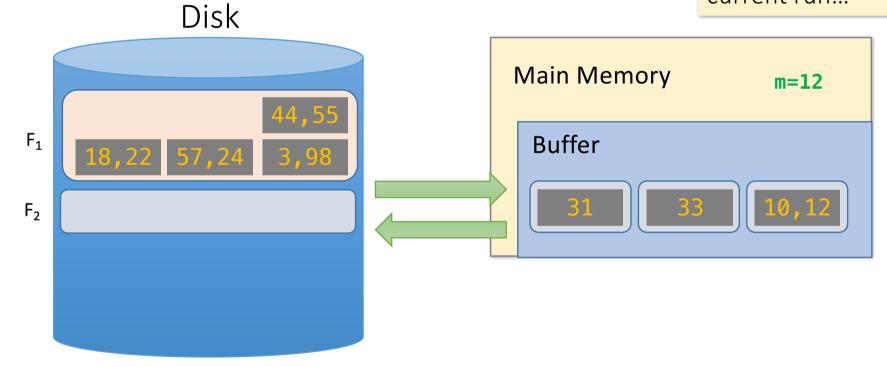

- With B+1 buffer pages, we can now start with *B***+1-length initial runs** (and use *B***-way merges) to get 2N(\left[\log_B \frac{N}{B+1}\right] + 1) IO cost...**
- Can we reduce this cost more by getting even longer initial runs?
- Use <u>repacking</u>- produce longer initial runs by "merging" in buffer as we sort at initial stage

• Start with unsorted single input file, and load 2 pages

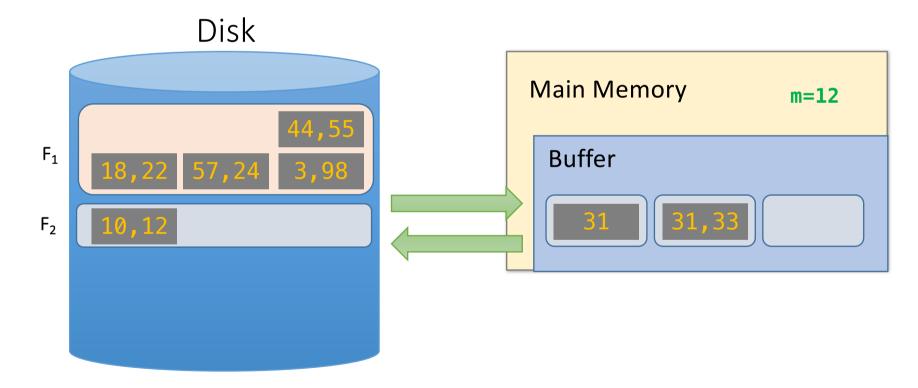

• Take the minimum two values, and put in output page

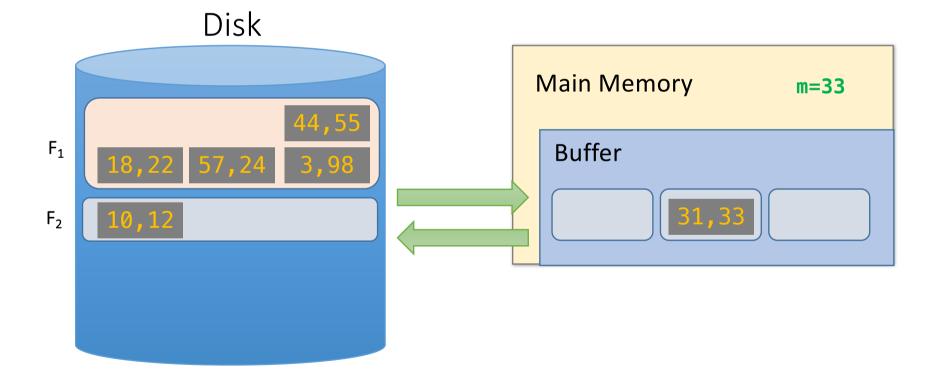

Also keep track of max (last) value in current run...

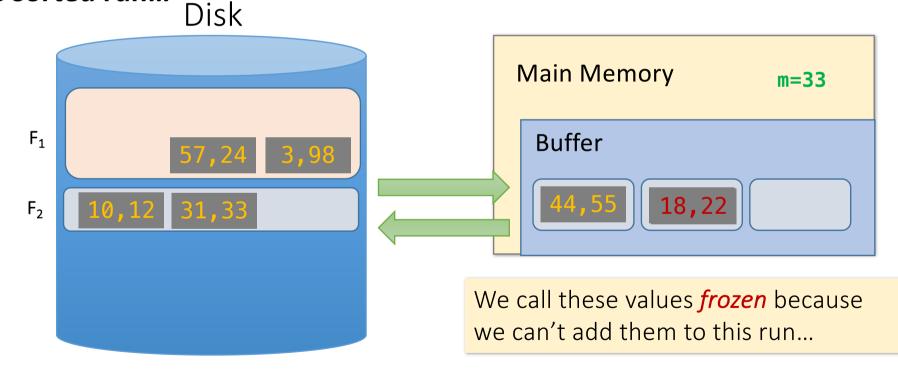

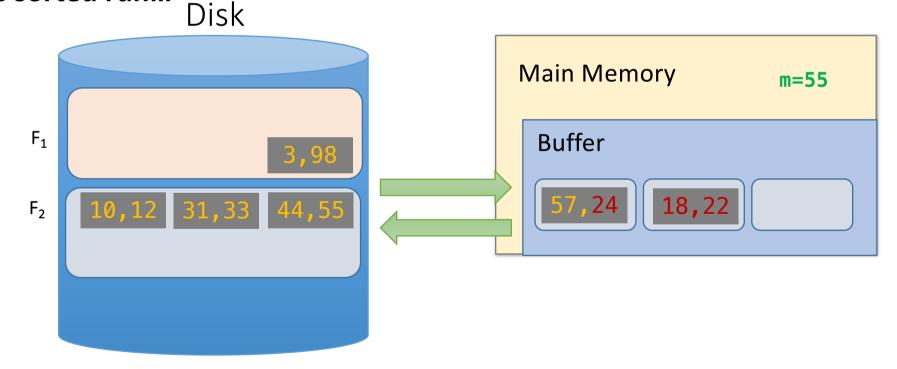

• Next, *repack*

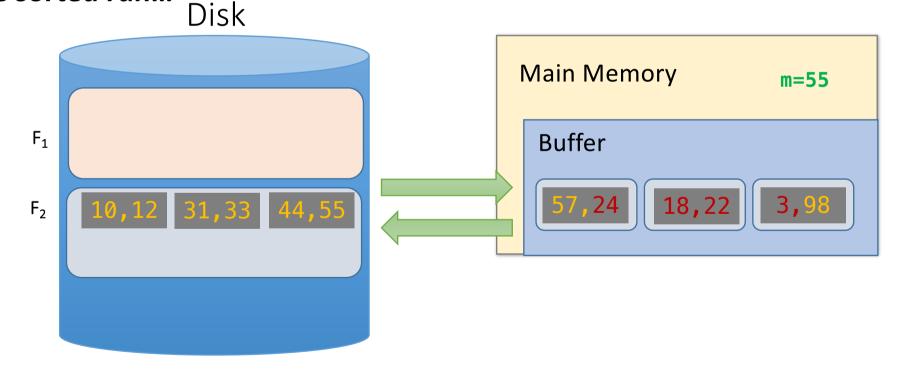

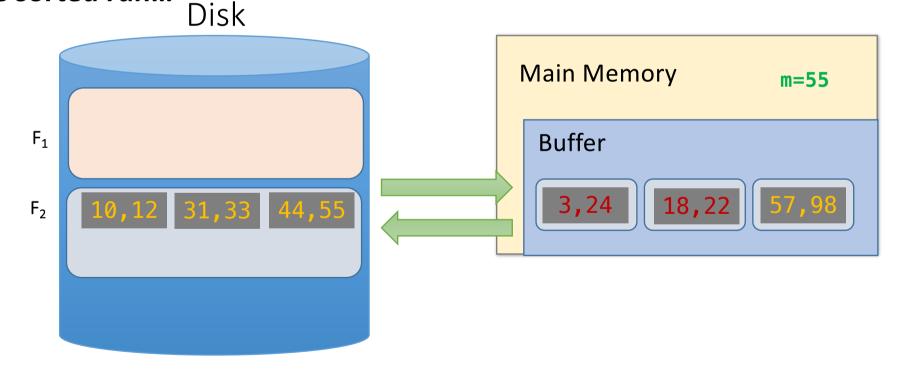

• Next, *repack*, then load another page and continue!

 Once all buffer pages have a frozen value, or input file is empty, start new run with the frozen values

 Once all buffer pages have a frozen value, or input file is empty, start new run with the frozen values

Repacking

- Note that, for buffer with B+1 pages:
 - If input file is sorted \rightarrow nothing is frozen \rightarrow we get **a single** run!
 - If input file is reverse sorted (worst case) → everything is frozen → we get runs of length B+1
- In general, with repacking we do **<u>no worse</u>** than without it!
- What if the file is already sorted?
- Engineer's approximation: runs will have ~2(B+1) length

$$\sim 2N(\left[\log_B \frac{N}{2(B+1)}\right] + 1)$$

Summary

- Basics of IO and buffer management.
 - See notebook for more fun! (Learn about *sequential flooding*)
- We introduced the IO cost model using **sorting**.
 - Saw how to do merges with few IOs,
 - Works better than main-memory sort algorithms.
- Described a few optimizations for sorting
